Safety

During use of electrical machinery, basic safety regulations should be followed in order to reduce the risk of fire, electrical accidents or personal injury. Therefore, always read the following instructions thoroughly before the machine is used. Save the instructions.

Protect against electrical accidents

Avoid contact with ground objects or surfaces such as wires, pipes, elements, electric stoves, refrigerators, etc. **An earth leakage circuit breakage should always be used.**

Do not abuse the machine

The machine works best when it is used within its capacity and design.

Let the motor "rest" periodically with a lower load. The motor will cool down and thus have a longer life. Use fuses with correct amperage in relation to the motor.

Electrical cables

Use the right cable in the right length and dimension (see accessory list).

Unplug the machine when not in use

Make sure the machine is not started unintentionally.

Use recommended safety equipment

Use face mask min. class P2 and approved ear cups.

Emptying the dust bag

After each completed sanding, the dust bag should be emptied and the contents kept safely outdoors due to potential fire hazard. In some concentrations sanding dust can cause explosions.

Pay attention while working

Use common sense. Don't run the machine if you are tired, if you have been drinking alcohol or taken drugs which can affect your judgement or control of your body. Due to a potential fire risk from sanding dust do not smoke whilst sanding.
